Transperineal pelvic floor prosthesis

A research group from the Andalusian Public Health System (SSPA) has developed a pelvic floor prosthetic device applied via the transperineal wound.

Description

The treatment of colorectal cancer sometimes entails an abdominoperineal amputation (APA) of the rectum. One of the problems posed by this intervention is the displacement of the small intestine into the space formerly occupied by the rectum.

The pelvic prosthesis developed by the research group is designed to be placed at the entrance of the pelvic cavity, to prevent its being occupied by the small intestine after an APA.

Aims

We are looking for a partner interested in a license and/or a collaboration agreement to further develop and exploit this innovative technology.

Classification

Area: Medical Device

Pathology: Musculoskeletal Disorders

Advantages

This device solves the problems posed by APA procedures.

Intellectual Property

This technology is protected by patent.
