

Therapies/Material and laboratory reagents

Method of obtaining a biomaterial

A research group from the Andalusian Public Health System has developed a method for obtaining a biomaterial for stem cell differentiation

Description

This new method of differentiation of stem cells on a three dimensional support, allows the production of cell types involved in bone regeneration in cell culture conditions that require additional differentiation factors and / or different from those present in the serum of the cell culture.

Intellectual Property

This technology is protected by patent.

Aims

The group is looking for a license agreement holding and / or collaboration

Advantages

This new biomaterial, allowing spontaneous differentiation of stem cells grown on said support in the presence of culture medium supplemented with fetal bovine serum only without additional growth factors.

Classification

Area: Therapy/Material and laboratory reagents
Technology: Biomaterials
