Description

The research group has developed a new free conditioned medium serum which promotes the in vitro proliferation and conservation potential pluripotency which allows maintaining an undifferentiated state of cancer stem cells (CSCs subpopulation and at the same time does not allow the survival of differentiated cells.

Objectives

This research group is seeking to establish a licensing agreement or an agreement public-private partnership for development of technology.

Advantages

This serum-free conditioned medium does not require prior manipulation of cells, and can also be from a small town with no extra cost.

Classification

Field: Medical Devices
Technology: Cell Culture
Patology: Oncology

Industrial / Intellectual Property

This technology is protected under patent.
