

## Therapy

### Endoscopic resection solution

A research group of the System Public Health of Andalusia (SSPA) has developed a new aqueous solution for use in the treatment of endoscopic resection of a portion of the mucosa (mucosectomy).

DE TECNOLOGÍA**  
Sistema Sanitario Público de Andalucía

#### Description

This new pharmaceutical aqueous solution containing hyaluronic acid among other compounds, can be used for the manufacture of a medicament for the surgical treatment by endoscopic resection and the resection of polyps and / or tumors in the gastrointestinal mucosa. The route of administration will be by injection of a therapeutically effective amount of such solution for endoscopic resection of a portion of the mucosa.

#### Advantages

This solution allows to obtain greater retention of the compound at the intestinal level, high tissue expansion by injecting a small amount of product, optimal viscosity (injection of product easily), total subsequent reabsorption of product administered, physicochemical stability at least of 24 hours and microbiological of at least 30 days.

#### Intellectual Property

This technology is protected by patent.

#### Aims

This research group is looking to establish a license agreement or agreement for public-private partnership for the development of technology.

#### Classification

Area: Therapy.

Technology: Injectable.

Pathology: Tumors gastrointestinal mucosa.
